

RAAIDD table

RAAIDD	Description
Risks	Subscriber data may contain missing values, and duplicates. Not enough historical churn data may be available to train a reliable model
Actions	Collect and validate the required data, clean and prepare the datasets, analyse churn patterns, build and test a predictive model, and present retention recommendations to stakeholders.
Assumptions	Historical subscriber behaviour contains patterns that can predict churn. Subscriber IDs can be used to link all datasets, and at least 36 months of historical data is available.
Issues	Historical churn records may be incomplete or inconsistent, making it difficult to accurately identify subscribers who have previously cancelled their subscription
Decisions	The project will focus on STADIOstream subscribers because reducing streaming churn is a key business priority, we want to retain the customers
Dependencies	Data must be collected before it can be cleaned and analysed. Data preparation must be completed before model development, and the model must be tested before retention recommendations can be made.
